Gibby Media Group Inc. based in Spokane, Washington USA, published and launched today a new International interactive website in partnership with the United Nations Commission on Sustainable Development Small Island Developing States Partnership in New Sustainable Technologies (UNCSD SIDSPINST). Gibby Media Group Inc has partnered with UNCSD SIDSPINST coordinated by Thomas J. Goreau, PHD, a marine scientist and biogeochemist from Jamaica, to provide a single one stop online location for the technology research community to post data and information on innovative technologies for sustainable development onto the website and a disc version. The website contains slide presentations, graphics, books, studies, articles, videos, and web links on a wide variety of innovative technologies and potential solutions to major energy, environmental, and economic problems affecting sustainable management of our planetary life support systems. Qualified individuals, researchers, scientific organizations, educational institutions, nonprofits, countries and corporations can post print, data and video related content onto the site, as approved by the distinguished Editorial Board. Anyone seriously interested can have access to the full material on the site if they agree to the terms of access, register and identify themselves. The site is located on a global cloud distribution network setup maintained by Gibby Media Group Inc. and viewable anywhere in the world. "Today, media is not all print, it's not all Internet, it's not all broadcasting and its not all discs, we are providing all four of these media integrated onto one single environmentally friendly website," stated Lon Gibby CEO of Gibby Media Group Inc. /publisher. The same content will be distributed in a physical format on Green ThinDisc, eventually replacing vast numbers of books, catalogs, newspapers, magazines, and DVDs. The greatly expanded 2nd Edition of the Green ThinDisc will be launched and distributed at the UN Conference on Sustainable Development in Rio de Janeiro, Brazil in June 2012, and distributed worldwide. Dr. Thomas J. Goreau, stated "I'm excited we now have a central online location for all this critical material. It will be accessible to more policymakers, funding agencies, students, and the world-wide public concerned with a sustainable future. Technology innovators now have a way to get their message out to the world. Critical information can now be disseminated in an improved, cost-efficient, and environmentally-friendly way online, as a constantly growing on-line encyclopedia of innovative solutions to the major problems facing humanity's future." The site is supported by sponsors and paid advertising from related environmental companies and products.
